

Tumor Antigen Specific mAb Immunotherapy and Combinations for Head and Neck Cancer

Robert L. Ferris, MD, PhD

Professor of Otolaryngology,
of Radiation Oncology and of Immunology
Chief, Division of Head and Neck Surgery

Associate Director for Translational Research
Co-Leader, Cancer Immunology Program
University of Pittsburgh Cancer Institute

Disclosures

“Heal with Steel”

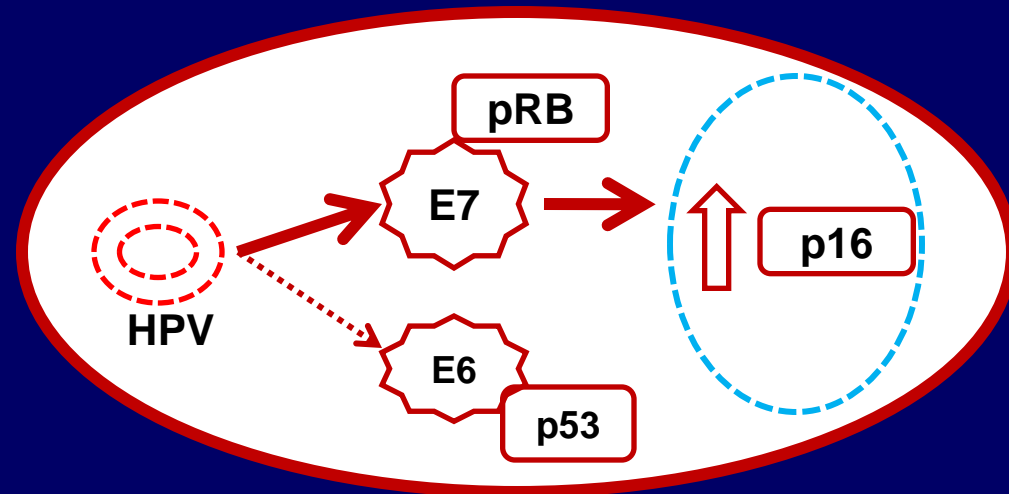

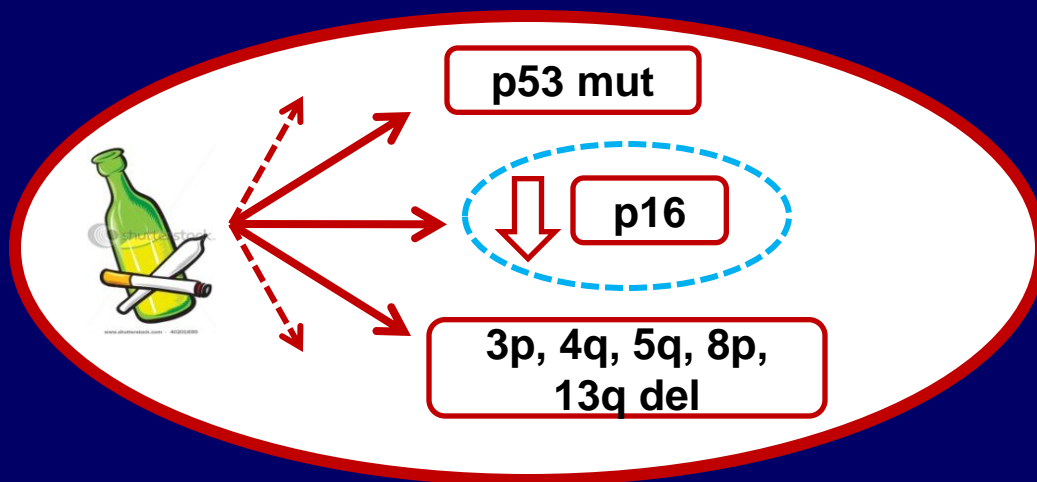

Amgen: Clinical trial/research funding

Bristol-Myers Squibb: Advisory board, Clinical trial/research funding VentiRx

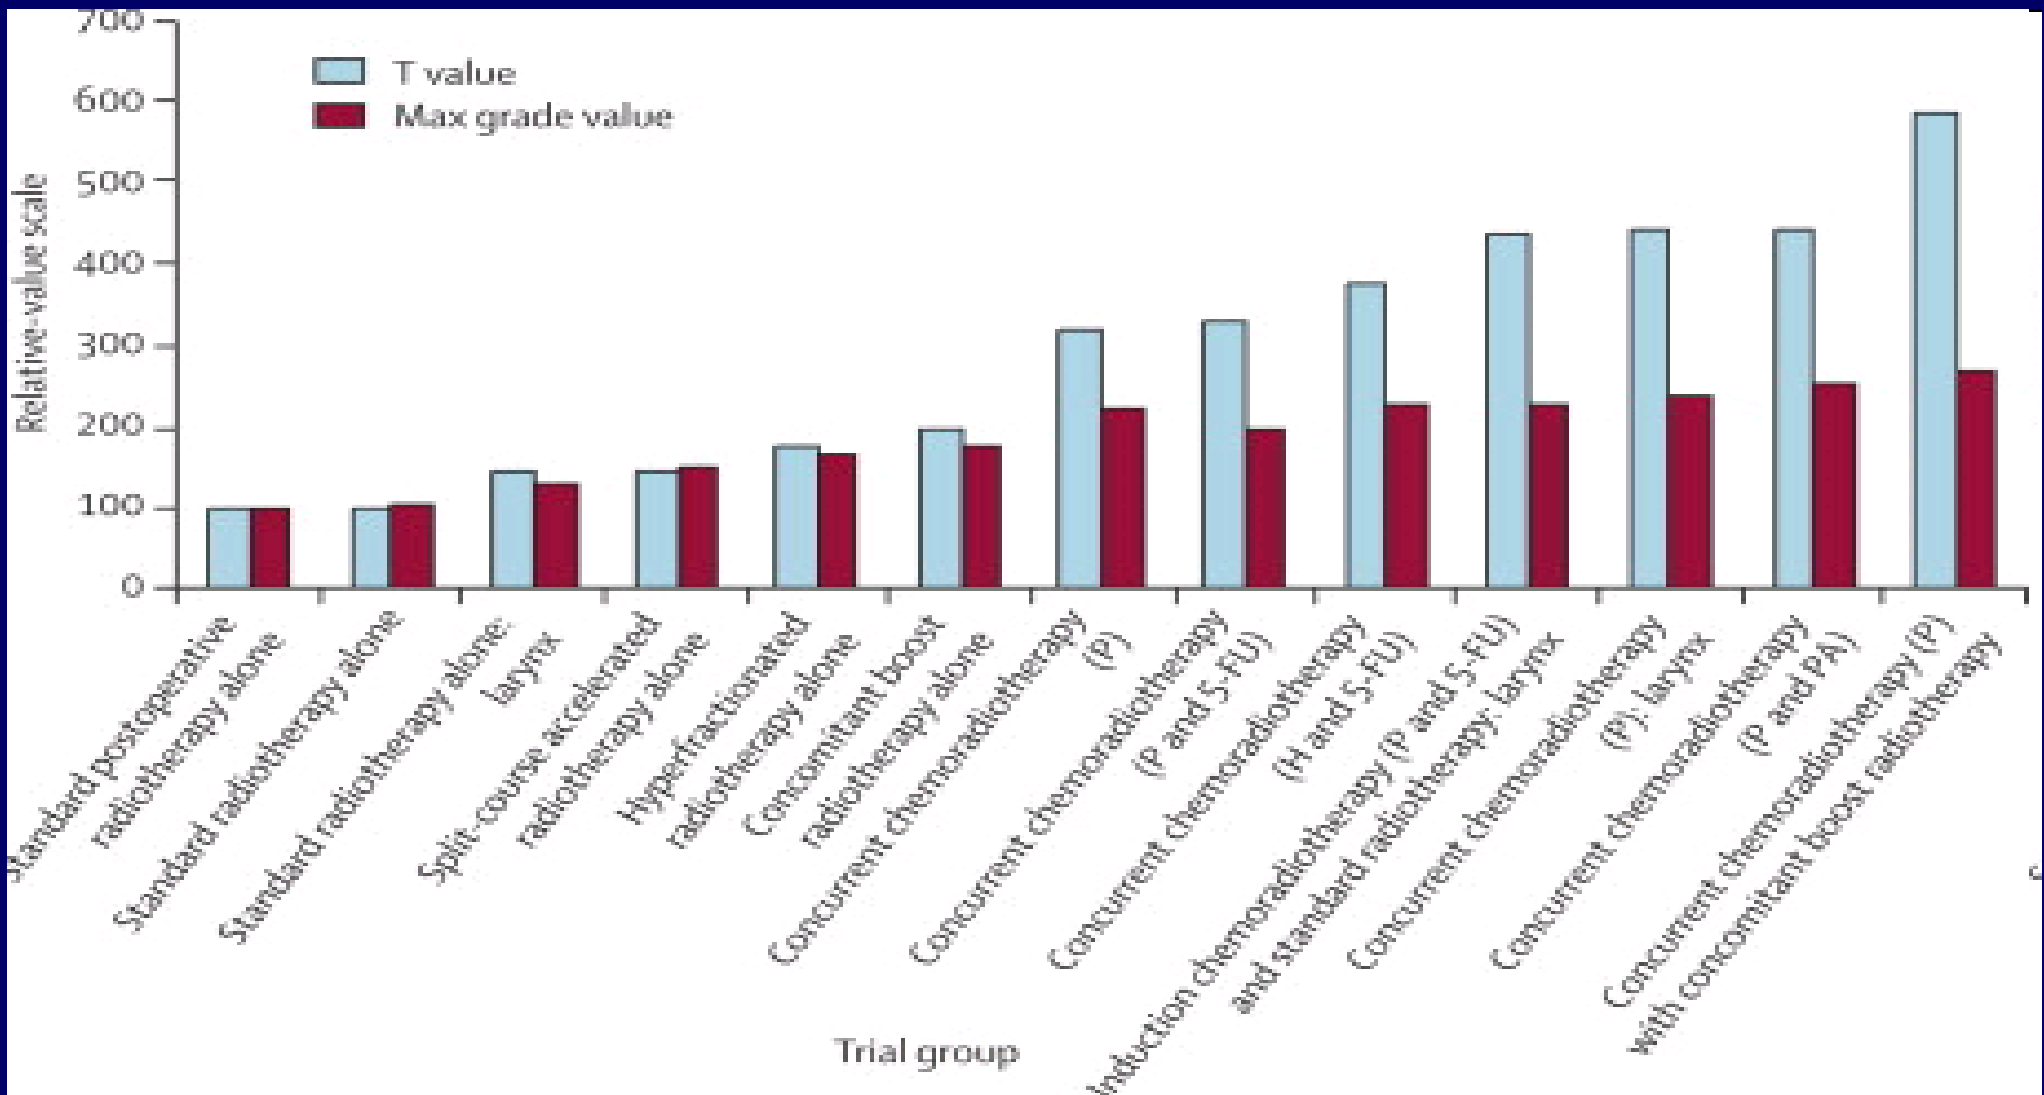

Pharmaceuticals: research funding

Two distinct diseases comprise HNC

Escalating Chemoradiation Morbidity

Trotti A et al. Lancet Oncol 2007;8:6713-24.

Convergence of “targeted therapy” with “immunotherapy”

The promise of tumor-targeted biological agents

- **Agents that do not directly attack DNA**
- **Directed against important biological/molecular targets – sparing the normal cells (bone marrow)**
- **Well-tolerated drugs that can be combined safely with cytotoxics**

EGFR - Human SCCHN (+ in 80-100%)

Ang et al. Cancer Research 2002
Grandis, et al. JNCI 1998

Cetuximab + RT in Locally Advanced SCCHN: Locoregional Control

Radiotherapy plus Cetuximab for Squamous-Cell Carcinoma of the Head and Neck

James A. Bonner, M.D., Paul M. Harari, M.D., Jordi Giralt, M.D., Nozar Azarnia, Ph.D., Dong M. Shin, M.D., Roger B. Cohen, M.D., Christopher U. Jones, M.D., Ranjan Sur, M.D., Ph.D., David Raben, M.D., Jacek Jassem, M.D., Ph.D., Roger Ove, M.D., Ph.D., Merrill S. Kies, M.D., Jose Baselga, M.D., Hagop Youssoufian, M.D., Nadia Amellal, M.D., Eric K. Rowinsky, M.D., and K. Kian Ang, M.D., Ph.D.*

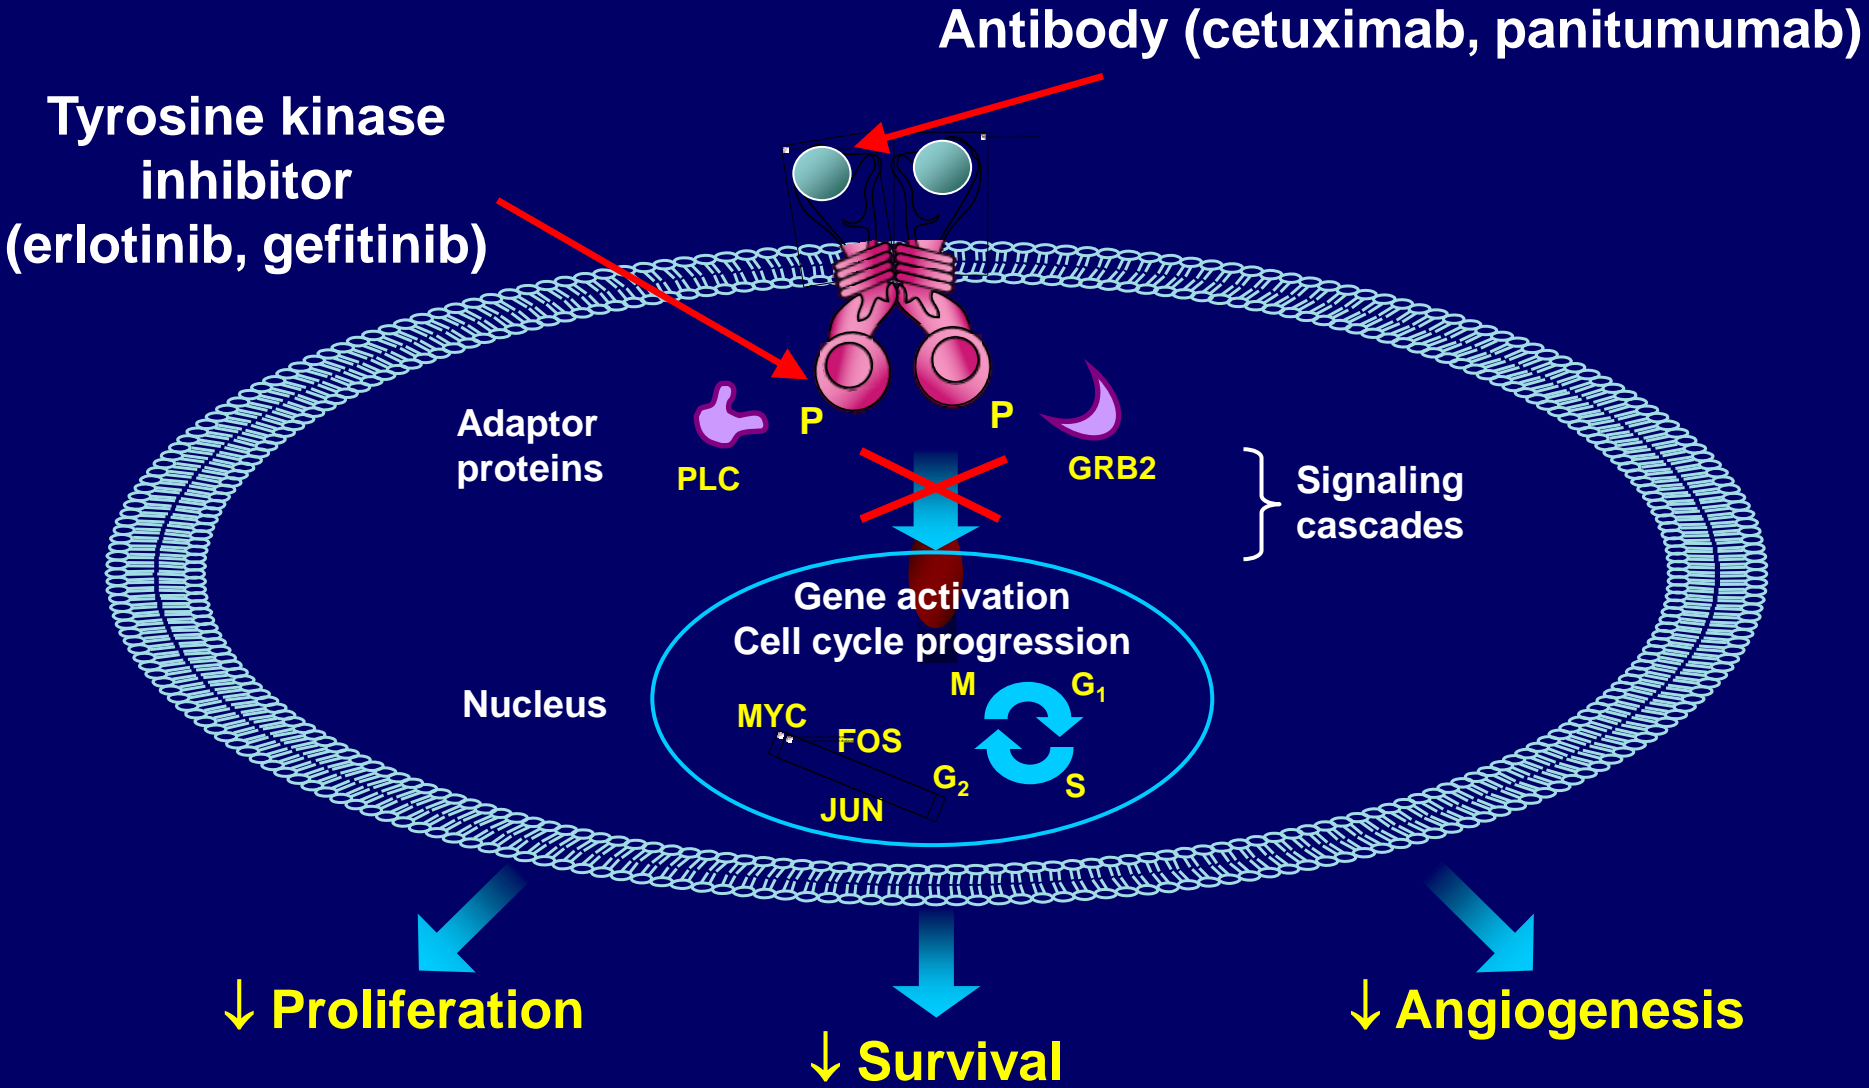

RTOG 1016: A Randomized Phase III Trial of Chemoradiotherapy With Cisplatin or Cetuximab in P16+ Oropharynx Cancer

Stratify: HPV, smoking, stage

Cetuximab loading dose = 400 mg/m² on Day 1 of Cycle 1 with induction

EGFR Inhibition – immune mechanism of action?

Cetuximab anti-EGFR monoclonal Ab

- IgG1 (chimeric mAb)
- High-affinity and prevents ligand binding to EGFR
- ↑ apoptosis ↓ angiogenesis
- Clinical anti-tumor activity in $\approx 20\%$ (Bonner, Vermorken), *not* correlated with level of EGFR expression or gene copy number

Structure of a mAb

Variable Portion

F(ab): epitope specific
In chimeric mAb this
portion is murine

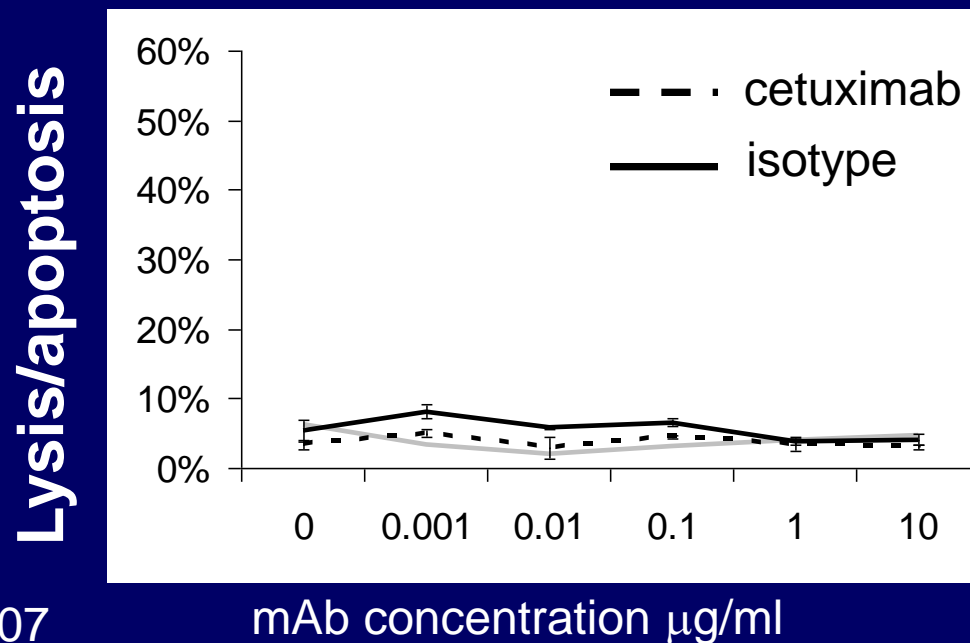

Fc Portion

Constant portion
(changes depending on the isotype)

**EGFR mAb therapy in SCCHN: inhibition of
phosphorylation or immunotherapy?**

Cetuximab blocks EGFR activation but does not kill HNC cells

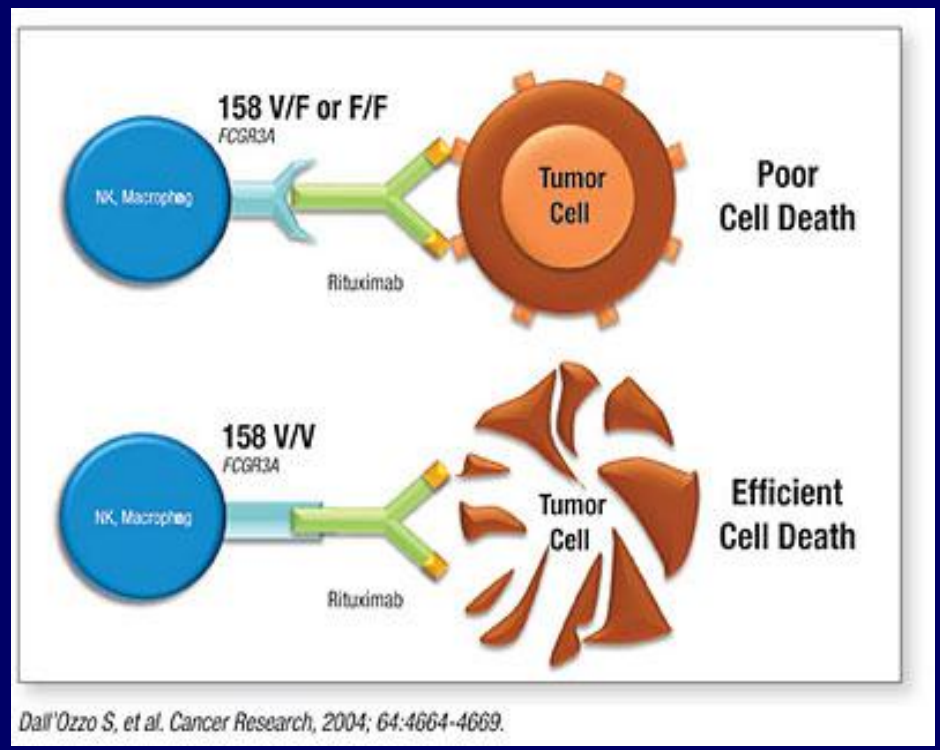

Antibody dependent cell cytotoxicity (ADCC)

- Polymerized mAb complexes trigger responses in macrophages and NK cells through the Fc γ R receptors
- There are several types of Fc γ R on *effector* cells, these variations influence the response against a mAb depending on its isotype.

Potential immune effect of mAb for cancer therapy – explanation for variability in responses

lysis

Modified from Adams et al *Nature Biotechnology* 23, 1147 - 1157 (2005)

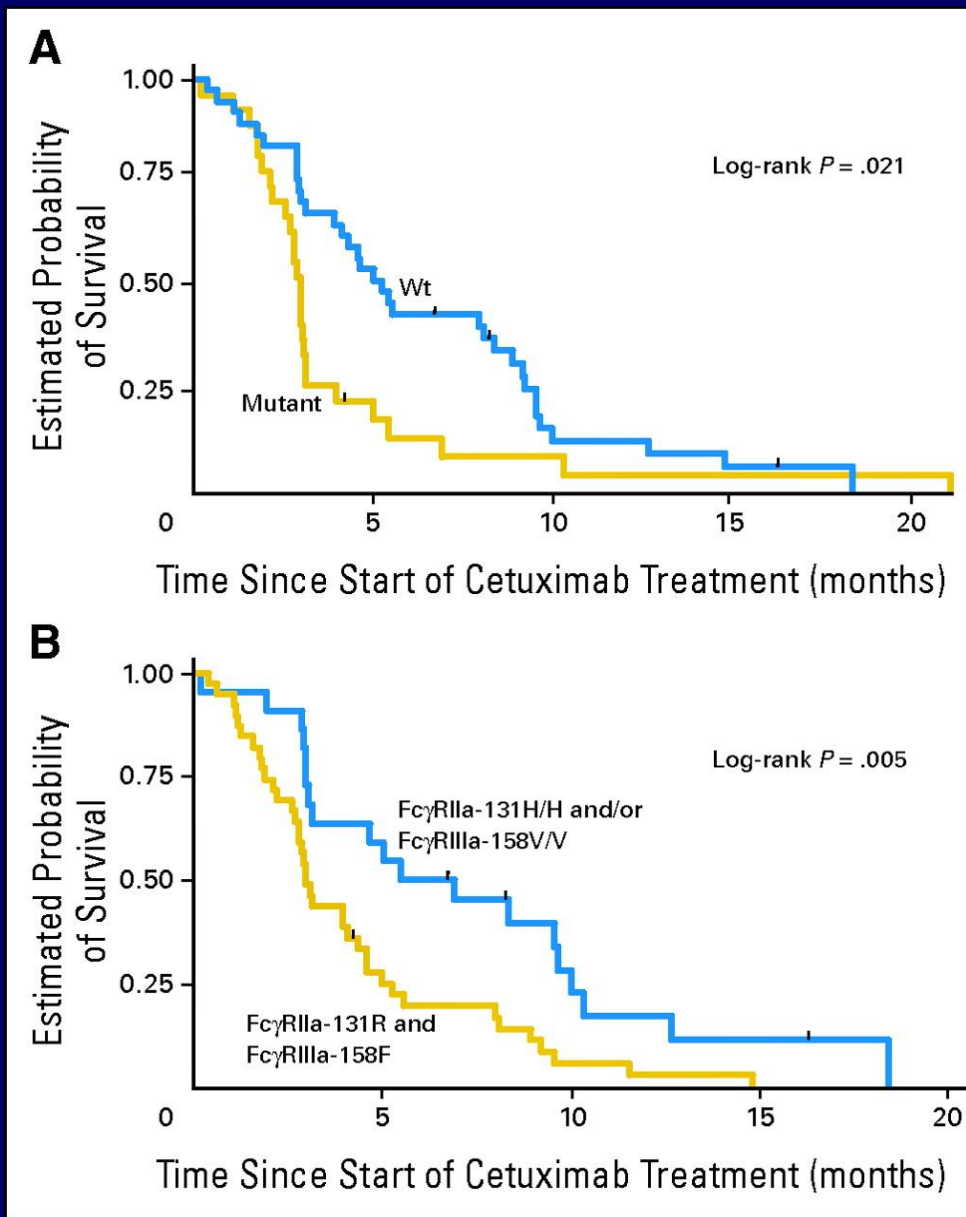

Cetuximab mediated ADCC correlates with FcγR genotype

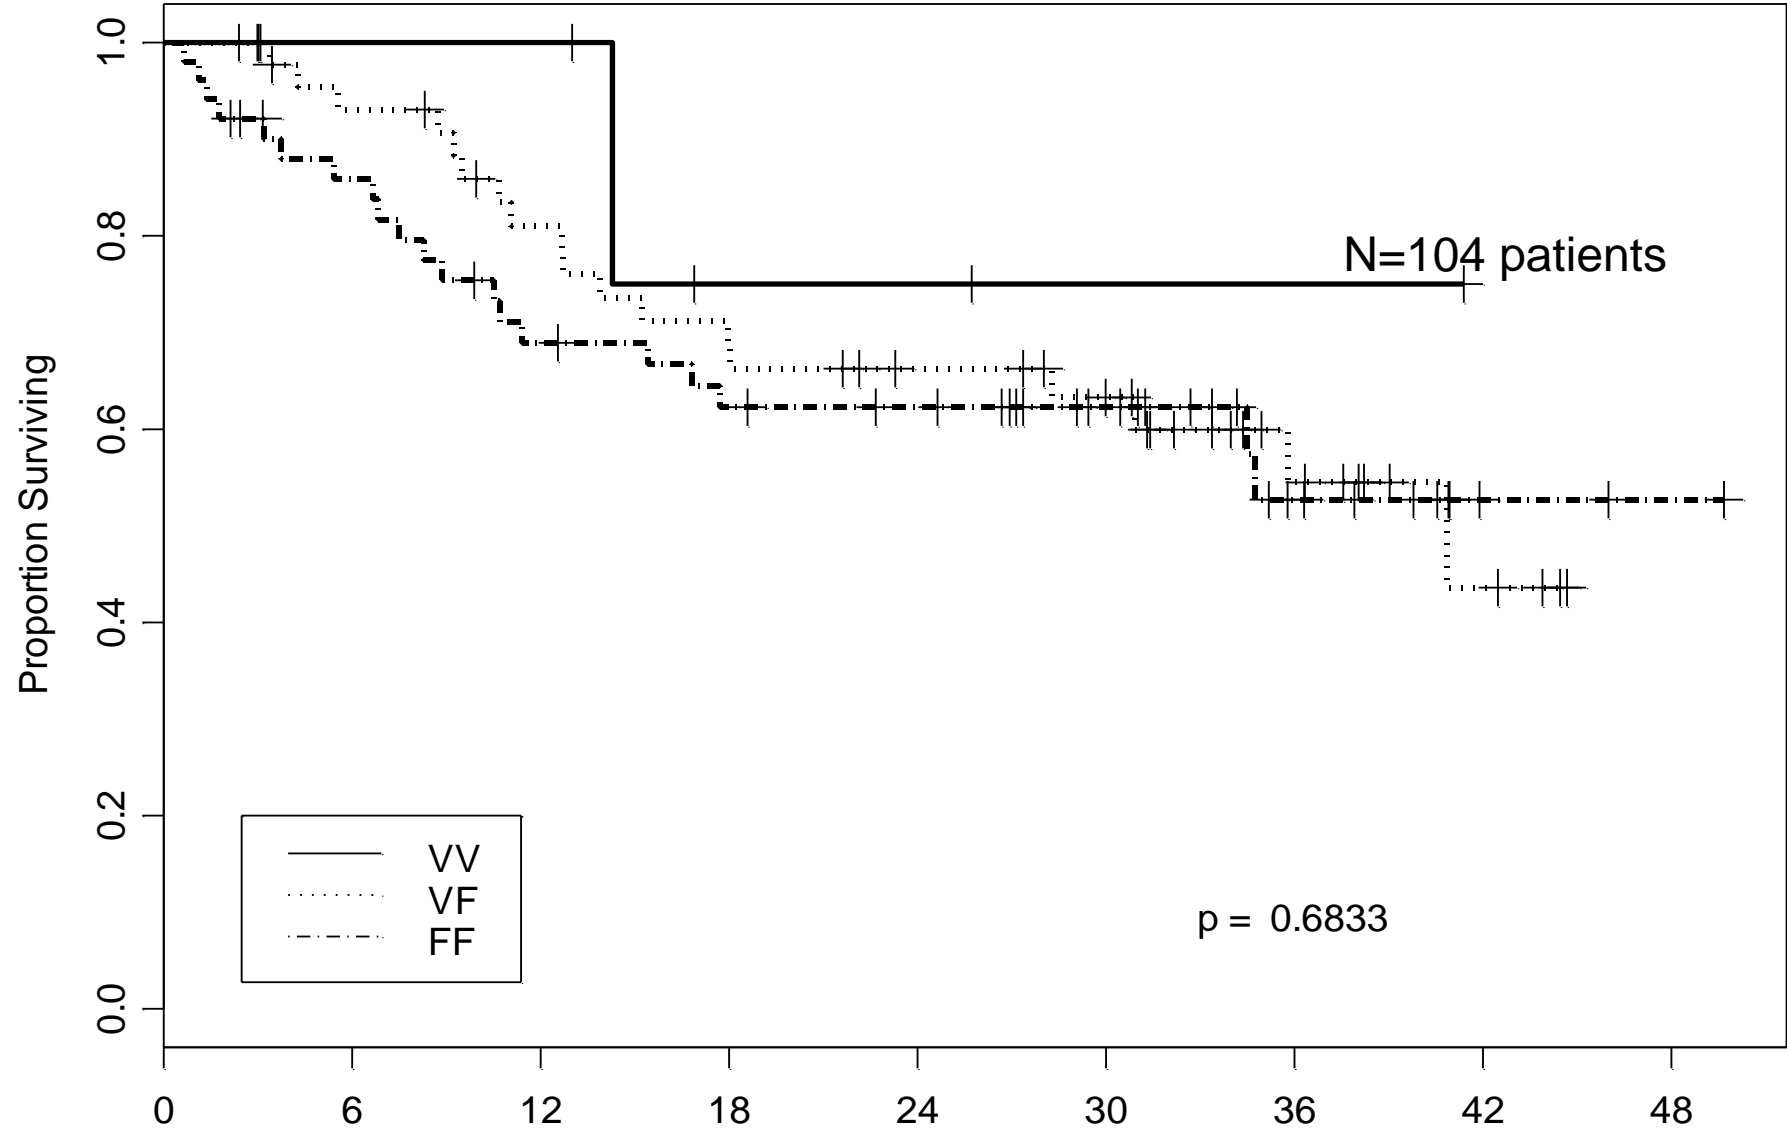

Progression-free survival for patients with metastatic colorectal cancer (mCRC) according to the presence or absence of (A) KRAS mutation and to the (B) Fc{gamma}R polymorphisms combination

Is cetuximab activity immune mediated?

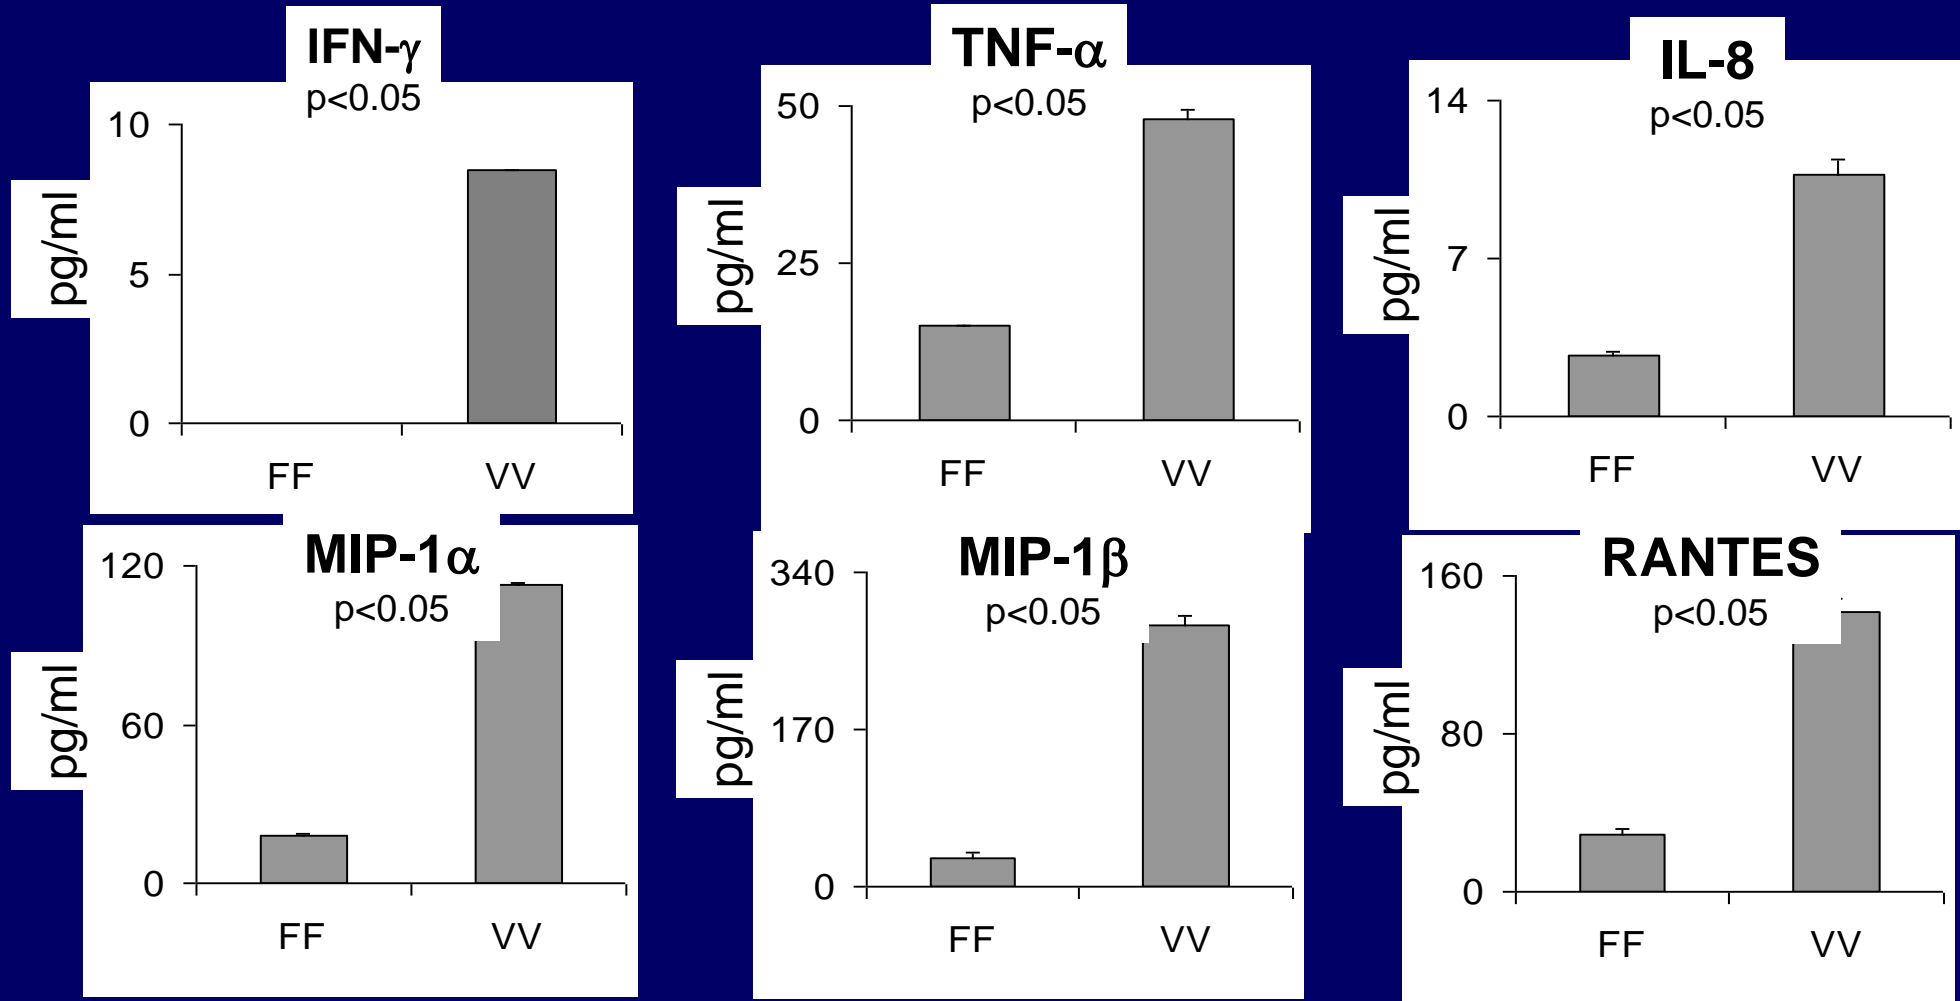

Bibeau, F. et al. J Clin Oncol; 27:1122-1129 2009

Disease-Specific Survival by FCgamma RIIIa

Cetuximab activated NK cells secrete cytokines and chemokines associated with recruitment of T cells and dendritic cells – bridging a network of antitumor lymphocyte activation?

ADCC

Cross-presentation of tumor antigens by DC

EGFR-specific tetramer+ T cell frequencies are elevated in cetuximab treated HNC patients compared cetuximab naïve HNC patients

Neoadjuvant Cetuximab

Followed by Surgery/CRT and adjuvant Cetuximab (UPCI Protocol #08-013)

R01 DE 19727
P50 CA097190

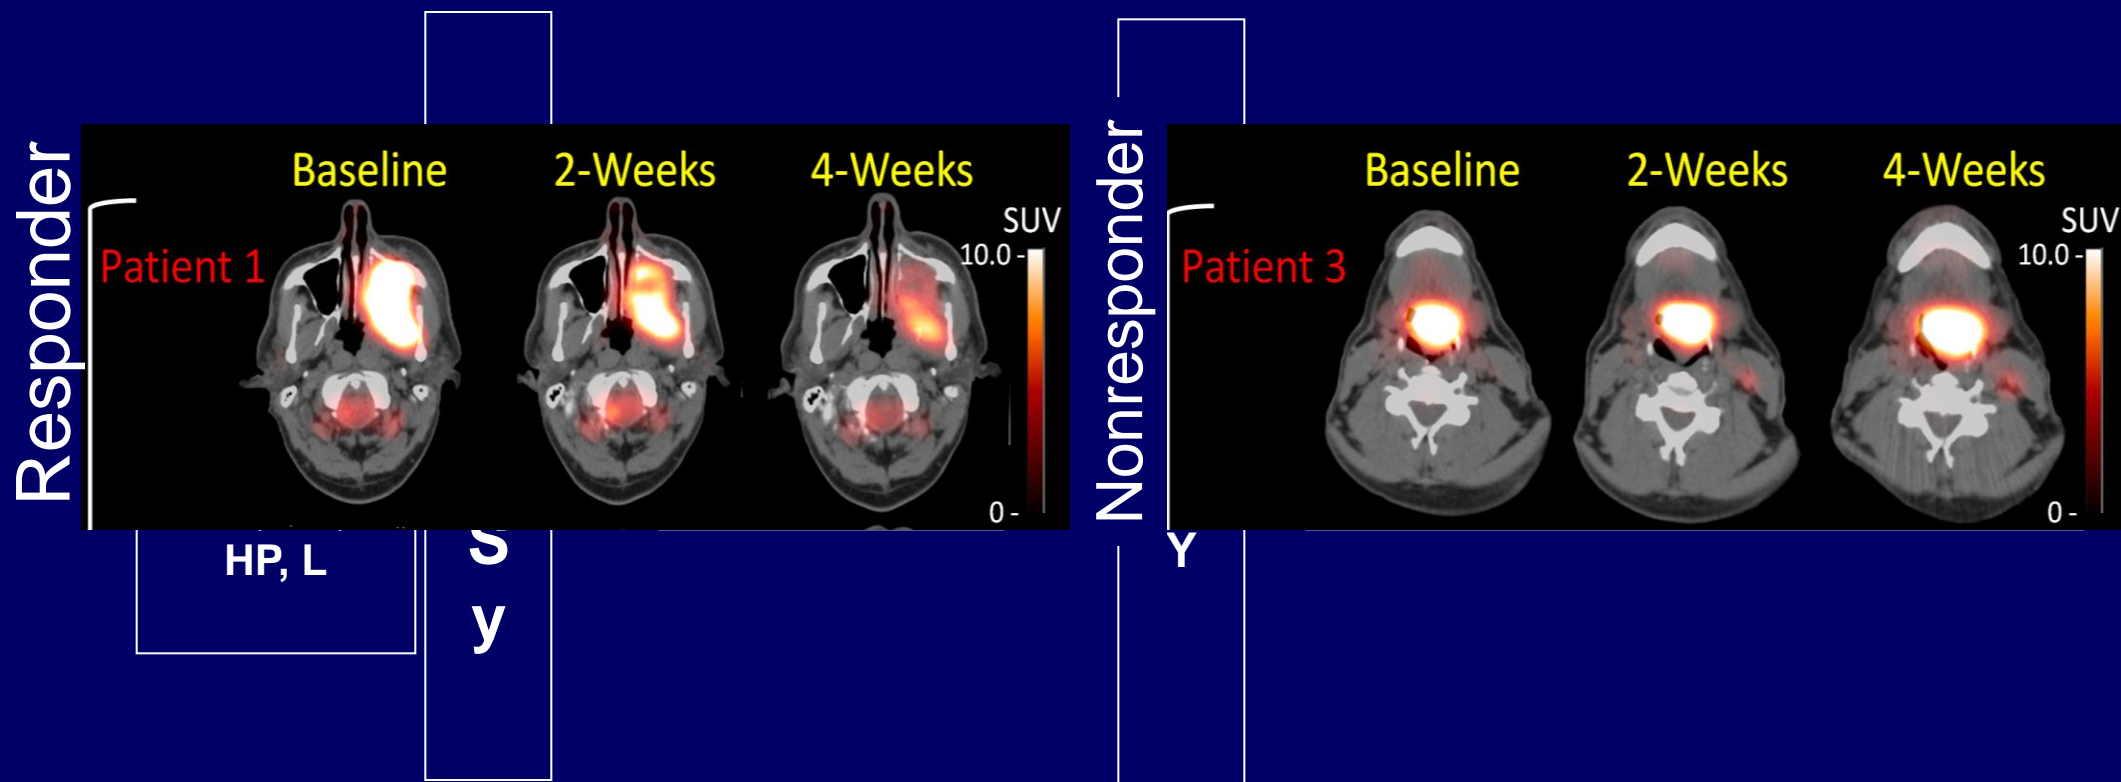

Endpoints:

Modulation of biomarkers, 2-yr DFS

Sample size N=33/40

PI - Ferris

Neoadjuvant Cetuximab Followed by Surgery and adjuvant Cetuximab (UPCI Protocol #08-013)

Endpoints:
Modulation of immune biomarkers, 2-yr PFS
ACCRUAL 33/40

Exhausted CD8⁺ T cells express PD-1 and Tim-3 during chronic antigen stimulation

Blocking inhibitory receptors to reactivate exhausted T cells

New immunotherapeutic targets: CTLA-4 and PD-1 (Programmed death 1)

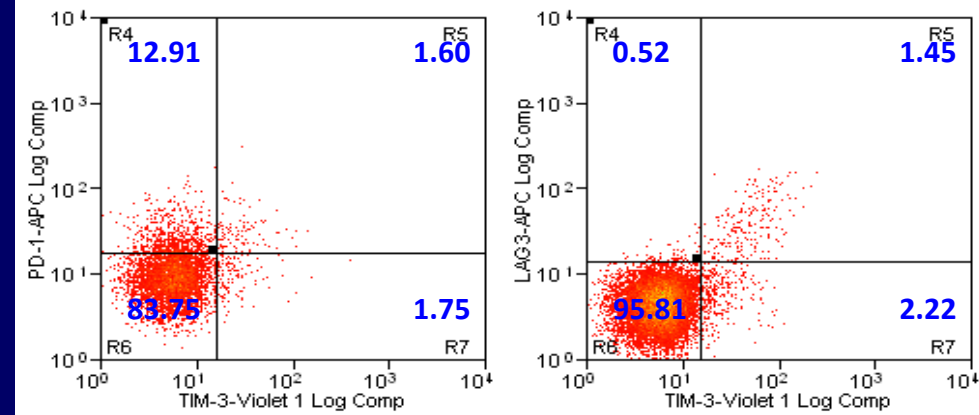

(* PD-Ligand expressed on cancer cells)

TIM-3, PD-1, and LAG-3 Expression by CD8⁺ TIL and PBL (HPV+ vs HPV-)

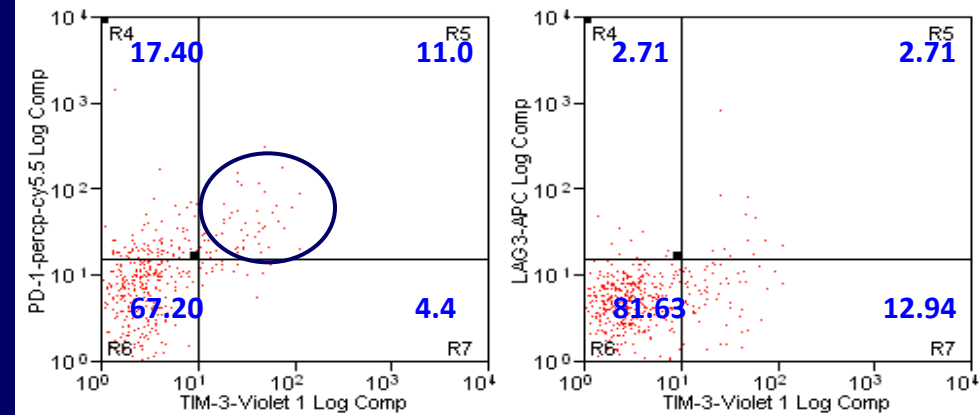

HPV-Positive Patient

HPV-Negative Patient

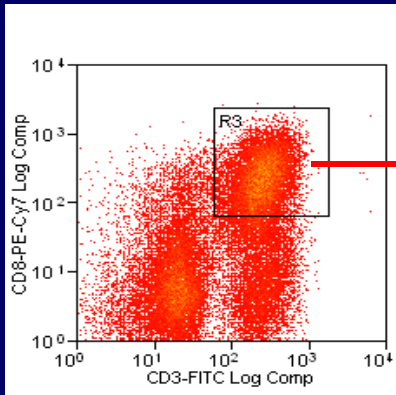

PBL

TIL

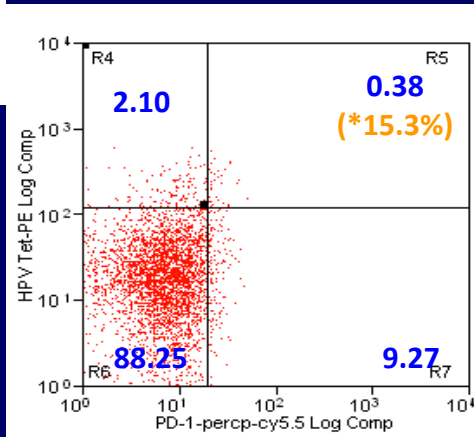

Checkpoint Receptors on HPV E7-Tetramer+ TIL (HPV+ Patient 11-6369)

* % in tetramer + Cells

PBL

TIL

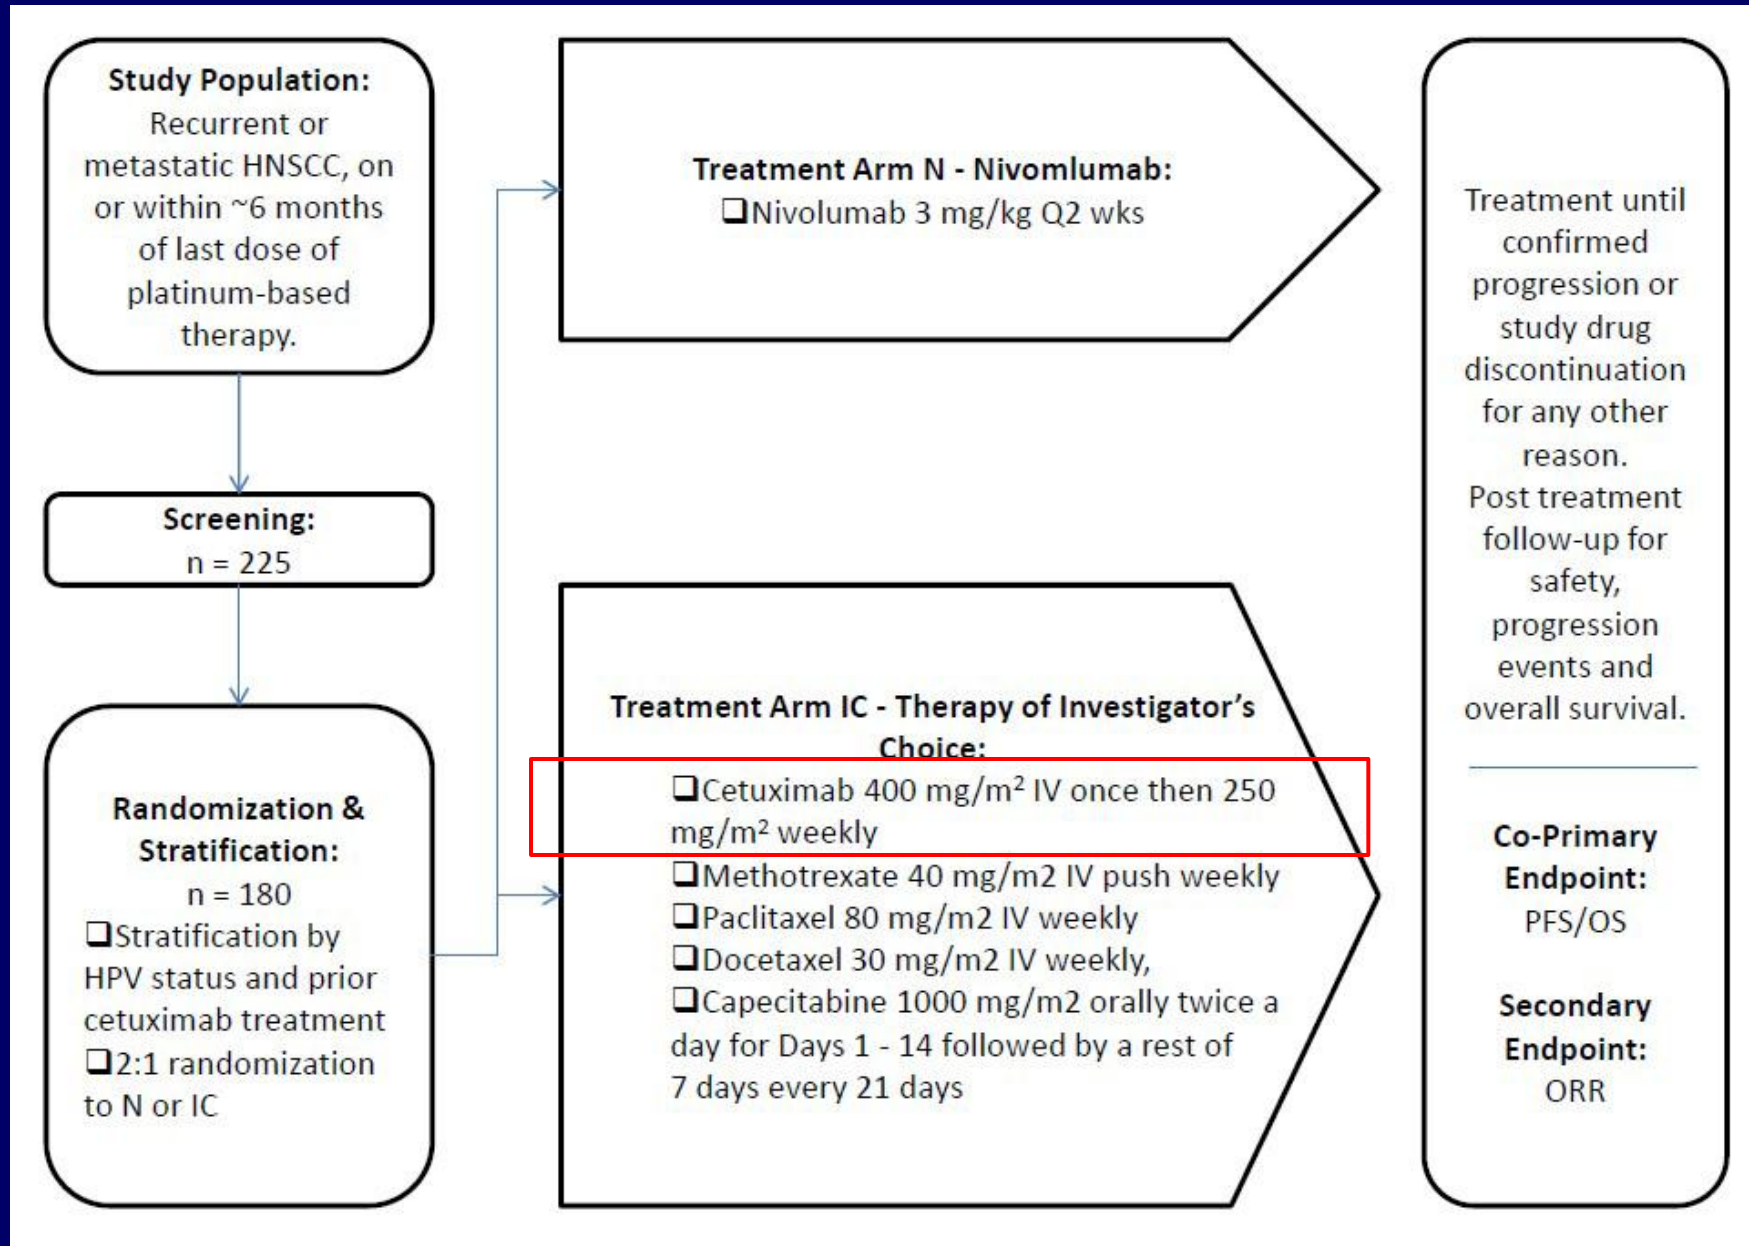

HPV+ sample contains higher proportion of
PD-1+/TIM-3+ cells on HPV E7-tetramer+ TIL than PBL

Targeting the PD-1/PD-L1 pathway

CA209-141: Randomized Phase II/III Trial of Nivolumab vs Cetuximab in Recurrent or Metastatic Platinum-refractory HNSCC

Immune Responses induced by cetuximab treatment

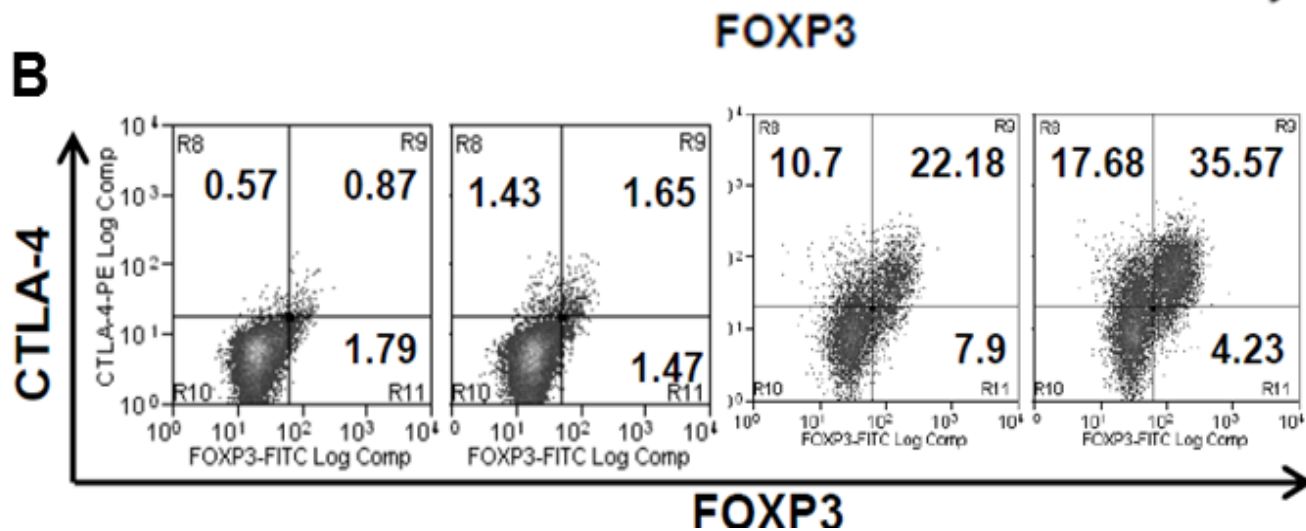

Cetuximab induces suppressor/regulatory T cells in treated HNSCC patients

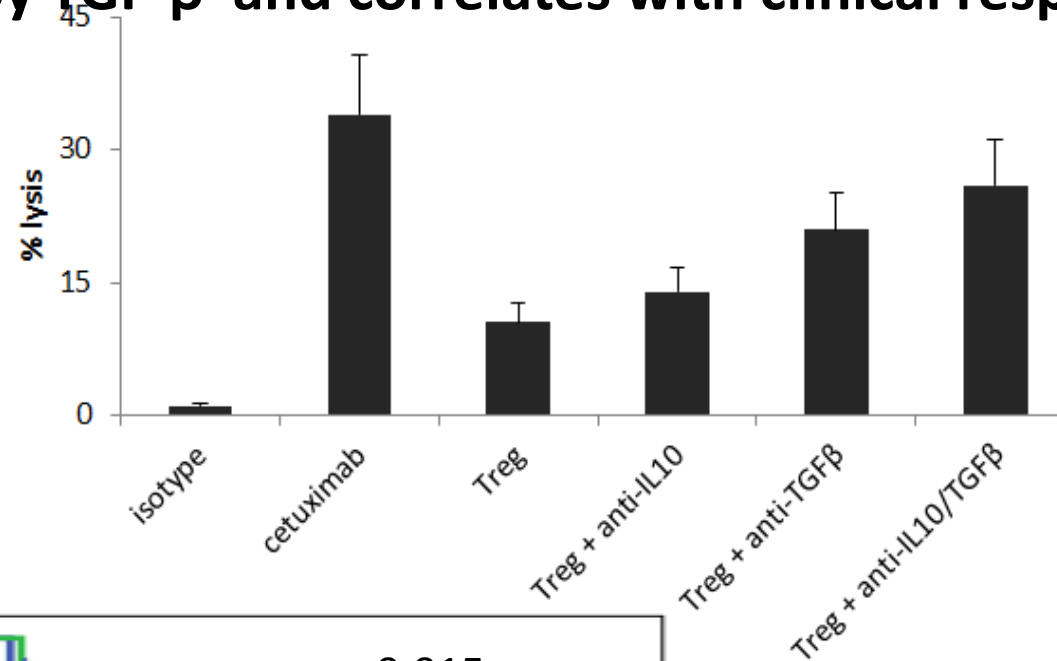

* paired Wilcoxon Sign test

Cetuximab induces CTLA-4+ Treg cells in treated HNSCC patients

Treg suppression of cetuximab mediated antitumor activity Is mediated by TGF- β and correlates with clinical response

$CD4^+CD39^+CD25^+$ Treg before cetuximab treatment:

■ > 6%

■ < 6%

Phase Ib Trial of Concurrent Cetuximab/IMRT with Ipilimumab, Plus Biomarker Correlatives, in Locally Advanced, High Risk Oropharynx Cancer

SCHEMA

Stage
III-IVA OPSCC
(HPV-
HPV+ smokers,
≥N2b)
p16 IHC
Tumor/
Blood collection

Cetuximab/Radiotherapy Plus Ipilimumab

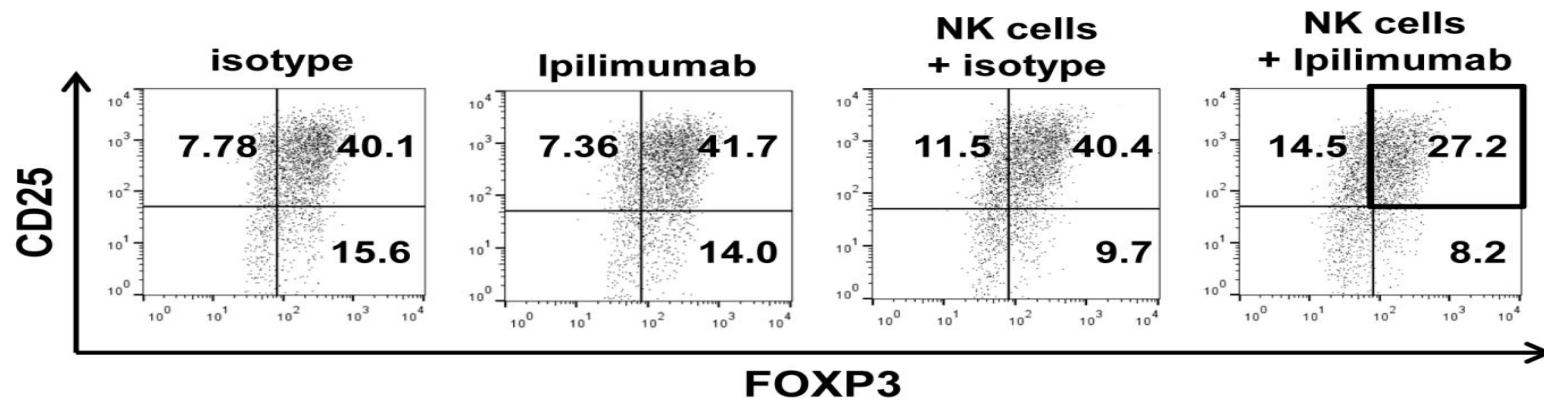

RT 66 Gy with 200 cGy daily fractions in 6.5 weeks

Cetuximab weekly at 250 mg/m² during radiation*

Ipilimumab 3, 10 mg/kg q21 days, starting week 4

*after loading dose of 400 mg/m² on cycle 1, day 1

Ipilimumab will be continued at indicated dose for additional 2 cycles.

Cetuximab:	-	-	+	+	+
Ipilimumab:	-	-	-	-	+

**E**

Summary

- Cellular immunity (antitumor NK and T cells) are induced by cetuximab
- Suppressive mechanisms include regulatory T cells (Treg) and checkpoint receptors (CTLA-4, PD-1, etc)
- But what else is clinically available for immunotherapy of HNC? -> Toll Like Receptor Adjuvants
 - TLR3 – poly IC:LC – plans for clinical trial
 - Active8: EXTREME +/- TLR8 agonist trial

Human TLR Family and Known Ligands

The Nobel Prize in Physiology or Medicine 2011

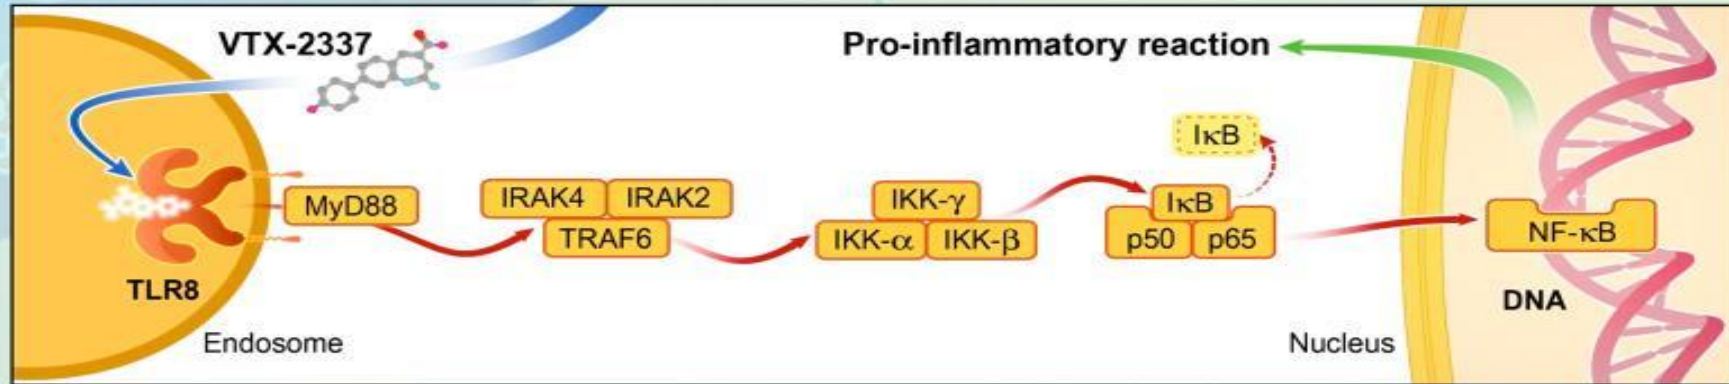

1 Innate immunity

Components of microorganisms bind to Toll-like receptors located on many cells in the body. This activates innate immunity, which leads to inflammation and to the destruction of invading microorganisms.

2 Adaptive immunity

Dendritic cells activate T lymphocytes, which initiates adaptive immunity. A cascade of immune reactions follows, with formation of antibodies and killer cells.

Toll-like Receptor 8 (TLR8) Pathway is Important in Human Immune Responses

- Activation induces potent Th1 immune response
- Expressed on myeloid dendritic cells (CD11c⁺), monocytes (CD14⁺), and natural killer cells (CD56⁺) in humans
- Induces significant IL-12 production in humans
- Can be activated by small molecule agonists

Endosome

Nucleus

DNA

TLR8 – expression and function

	TLR8		
Expression	Myeloid DC, Monocytes	Plasmacytoid DC	Plasmacytoid DC, B-cells
Natural Ligand	ssRNA	ssRNA	Bacterial DNA
Small Molecule Agonist	Yes	Yes	No
IL-12 induction	Yes	No	No
TNF α induction	Yes	No	No
IFN α induction	No	Yes	Yes

Antibody-Dependent Cell-Mediated Cytotoxicity (ADCC) Can Augment Tumor Cell Killing

Phase 1b Head & Neck Trial: VTX-2337 + cetuximab

Representative Flow Cytometry Data

Targeting EXTREME Patient Population

- First-line therapy in locally advanced and metastatic head and neck cancer
- SOC: platinum, 5-FU, cetuximab
- 477 patients cisplatin (approx 60%) or carboplatin
- Primary Tumor sites:
 - oropharynx
 - hypopharynx
 - larynx

	PF + cetux	PF
OS	10.1 m	7.4 m
PFS	5.6 m	3.3 m
ORR	36%	20%
Disease Control	81%	60%

NEJM 2008;359:1116

Kaplan-Meier Estimates of Overall Survival and Progression-free Survival According to the Treatment Group

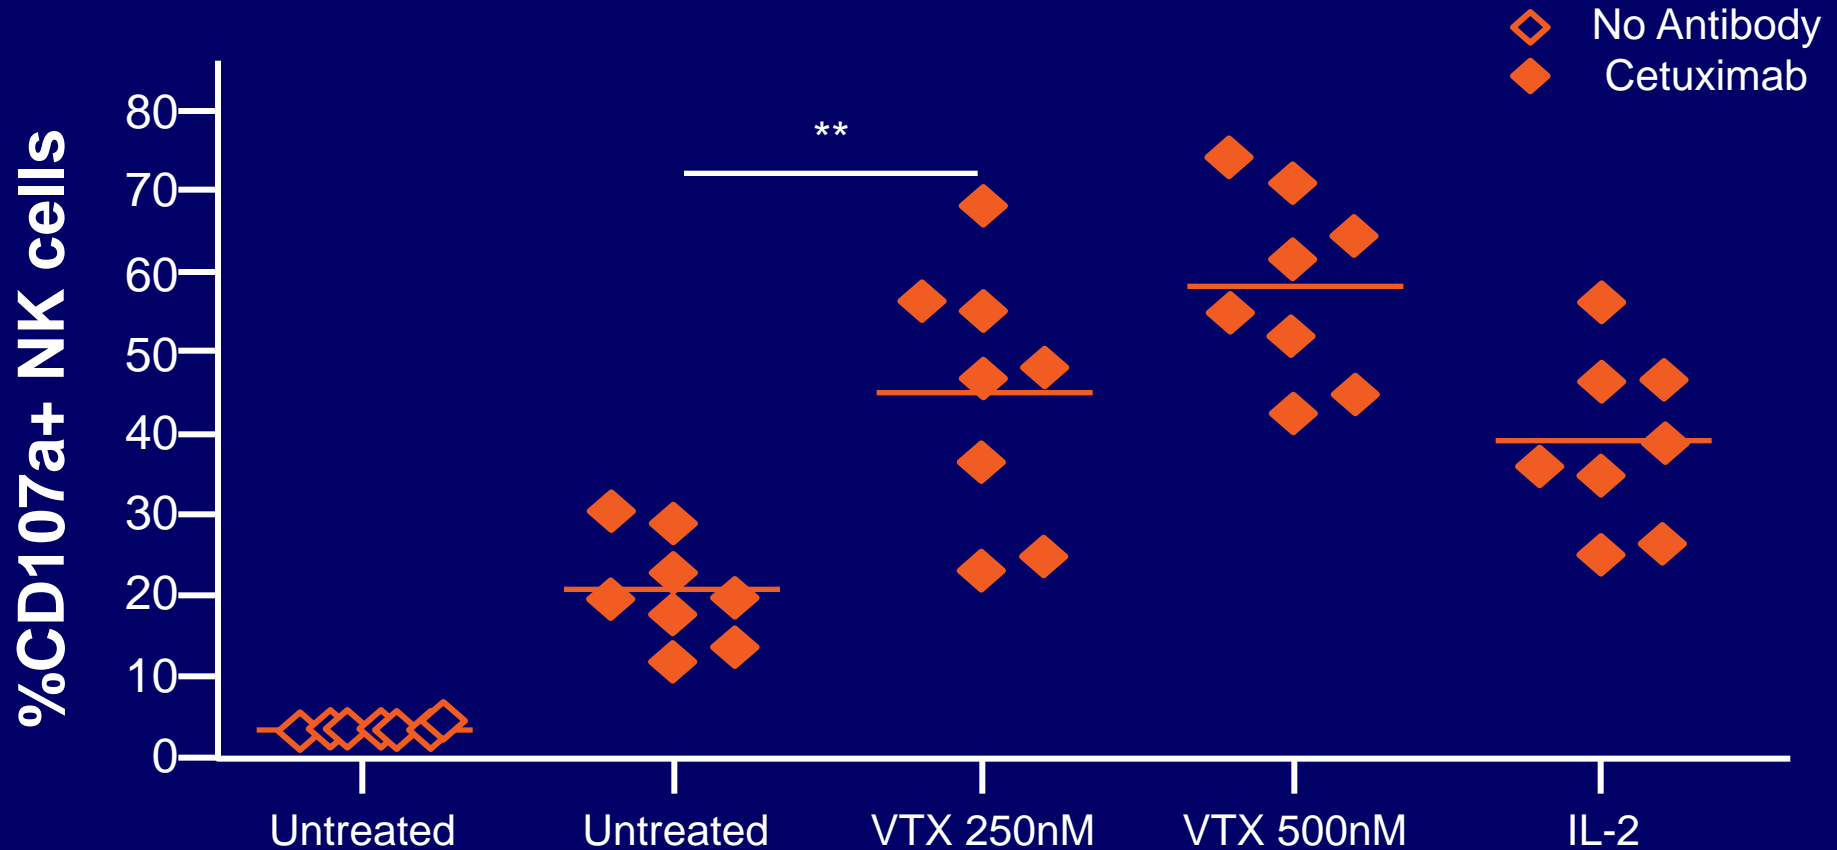

No. at Risk	0	3	6	9	12	15	18	21	24
Chemotherapy	220	173	127	83	65	47	19	8	1
Chemotherapy plus cetuximab	222	184	153	118	82	57	30	15	3

No. at Risk	0	3	6	9	12	15	18	21	24
Chemotherapy	220	103	29	8	3	1			
Chemotherapy plus cetuximab	222	138	72	29	12	7			

VTX-2337 enhanced cetuximab-dependent degranulation of NK cells

TLR8 stimulation (VTX-2337) May Enhance T cell priming Effects of mAb Response

ADCC

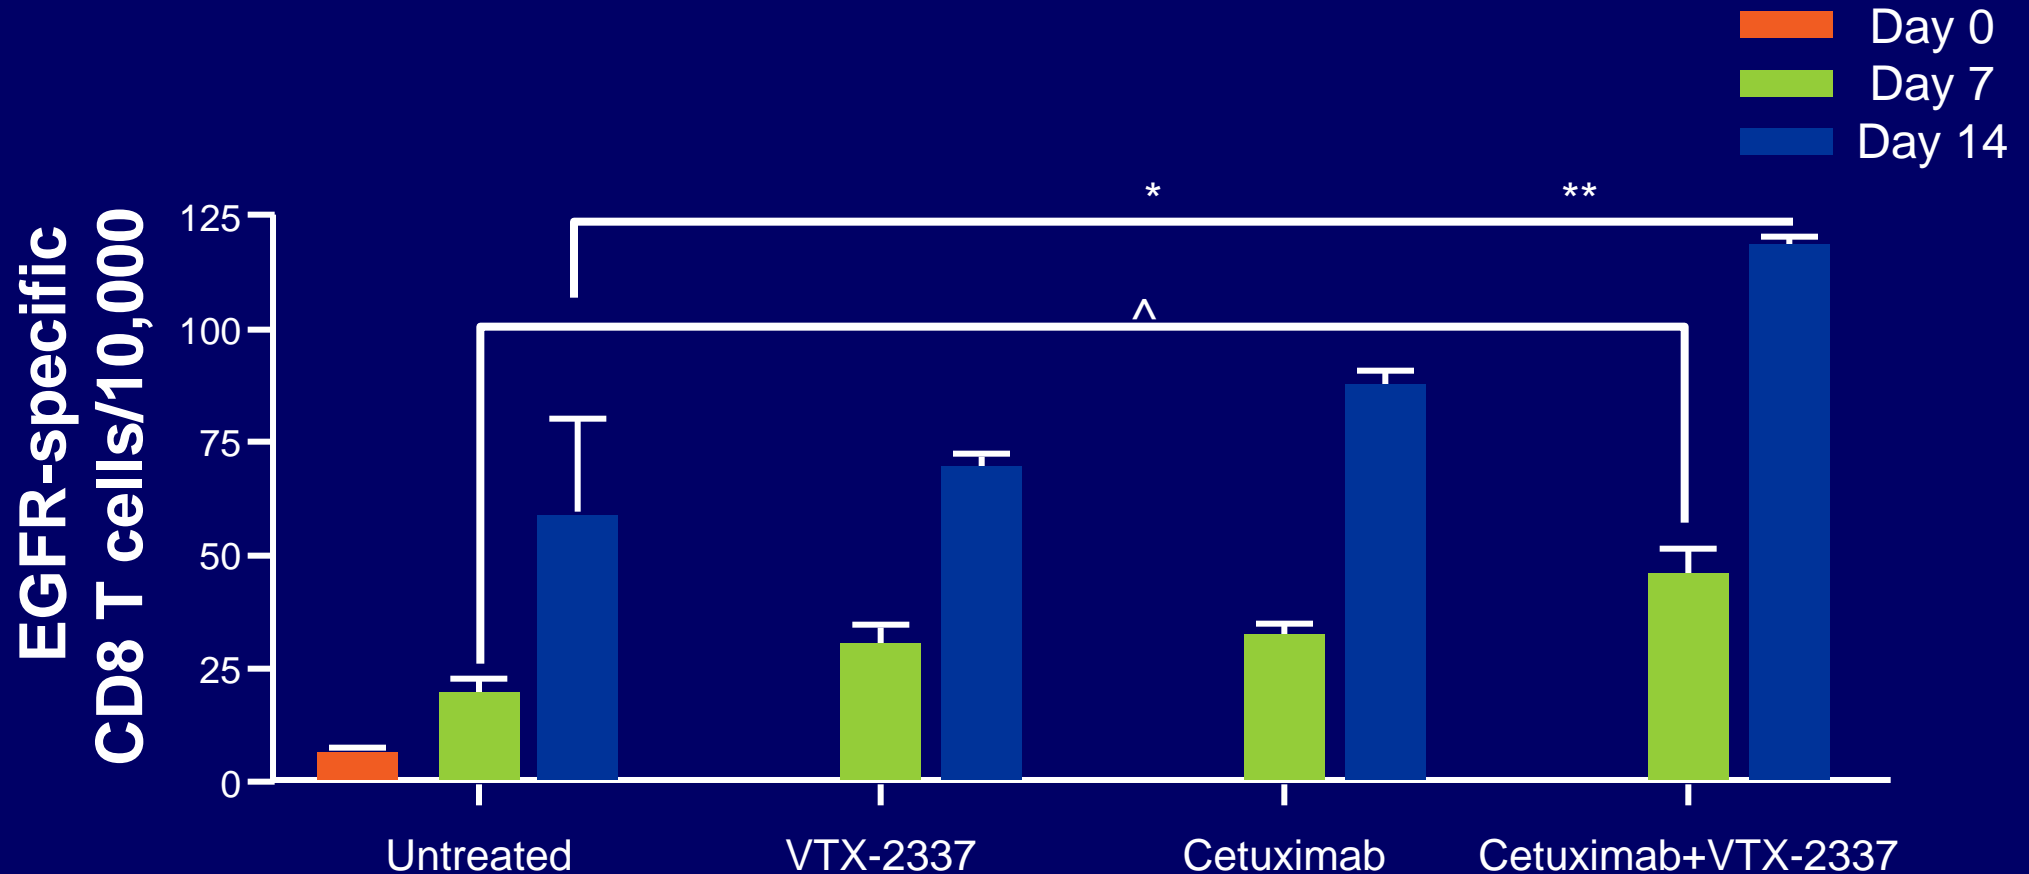

Cross-presentation of tumor antigens by DC

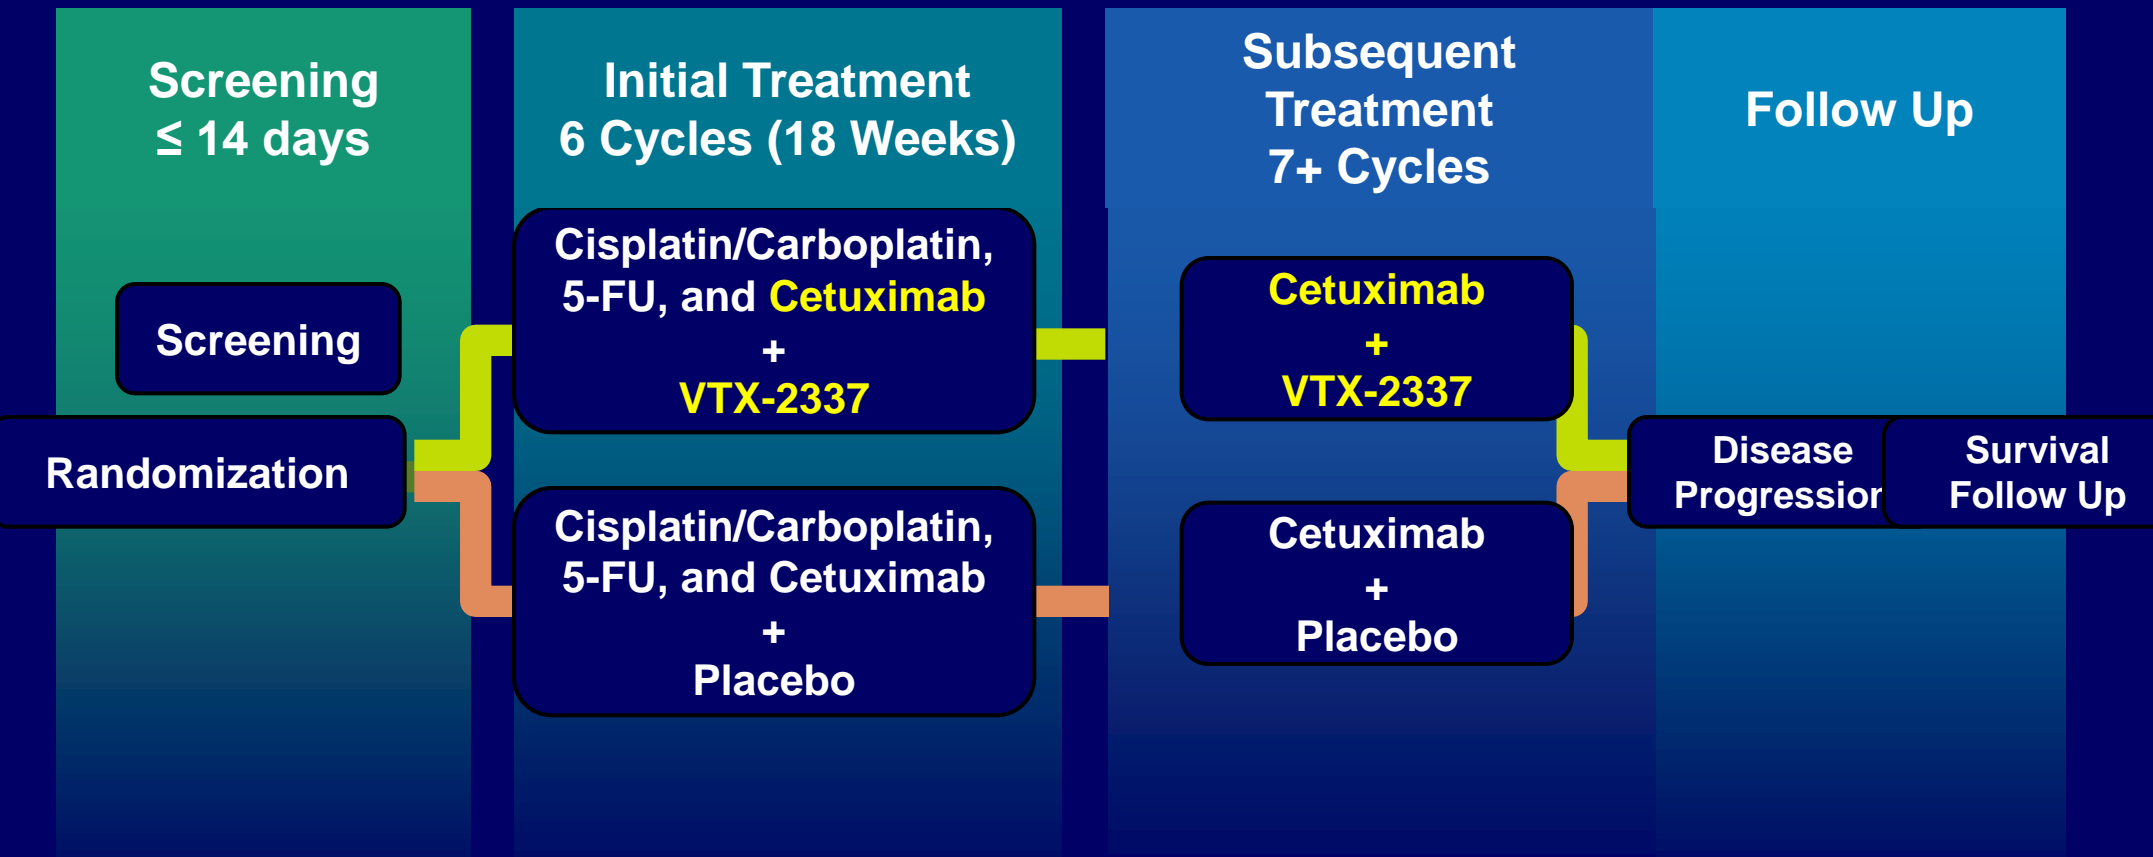

TLR8+ myeloid Dendritic Cell

In vitro stimulation of EGFR-specific T cells is enhanced by VTX-2337 stimulated, cetuximab-treated NK:DC

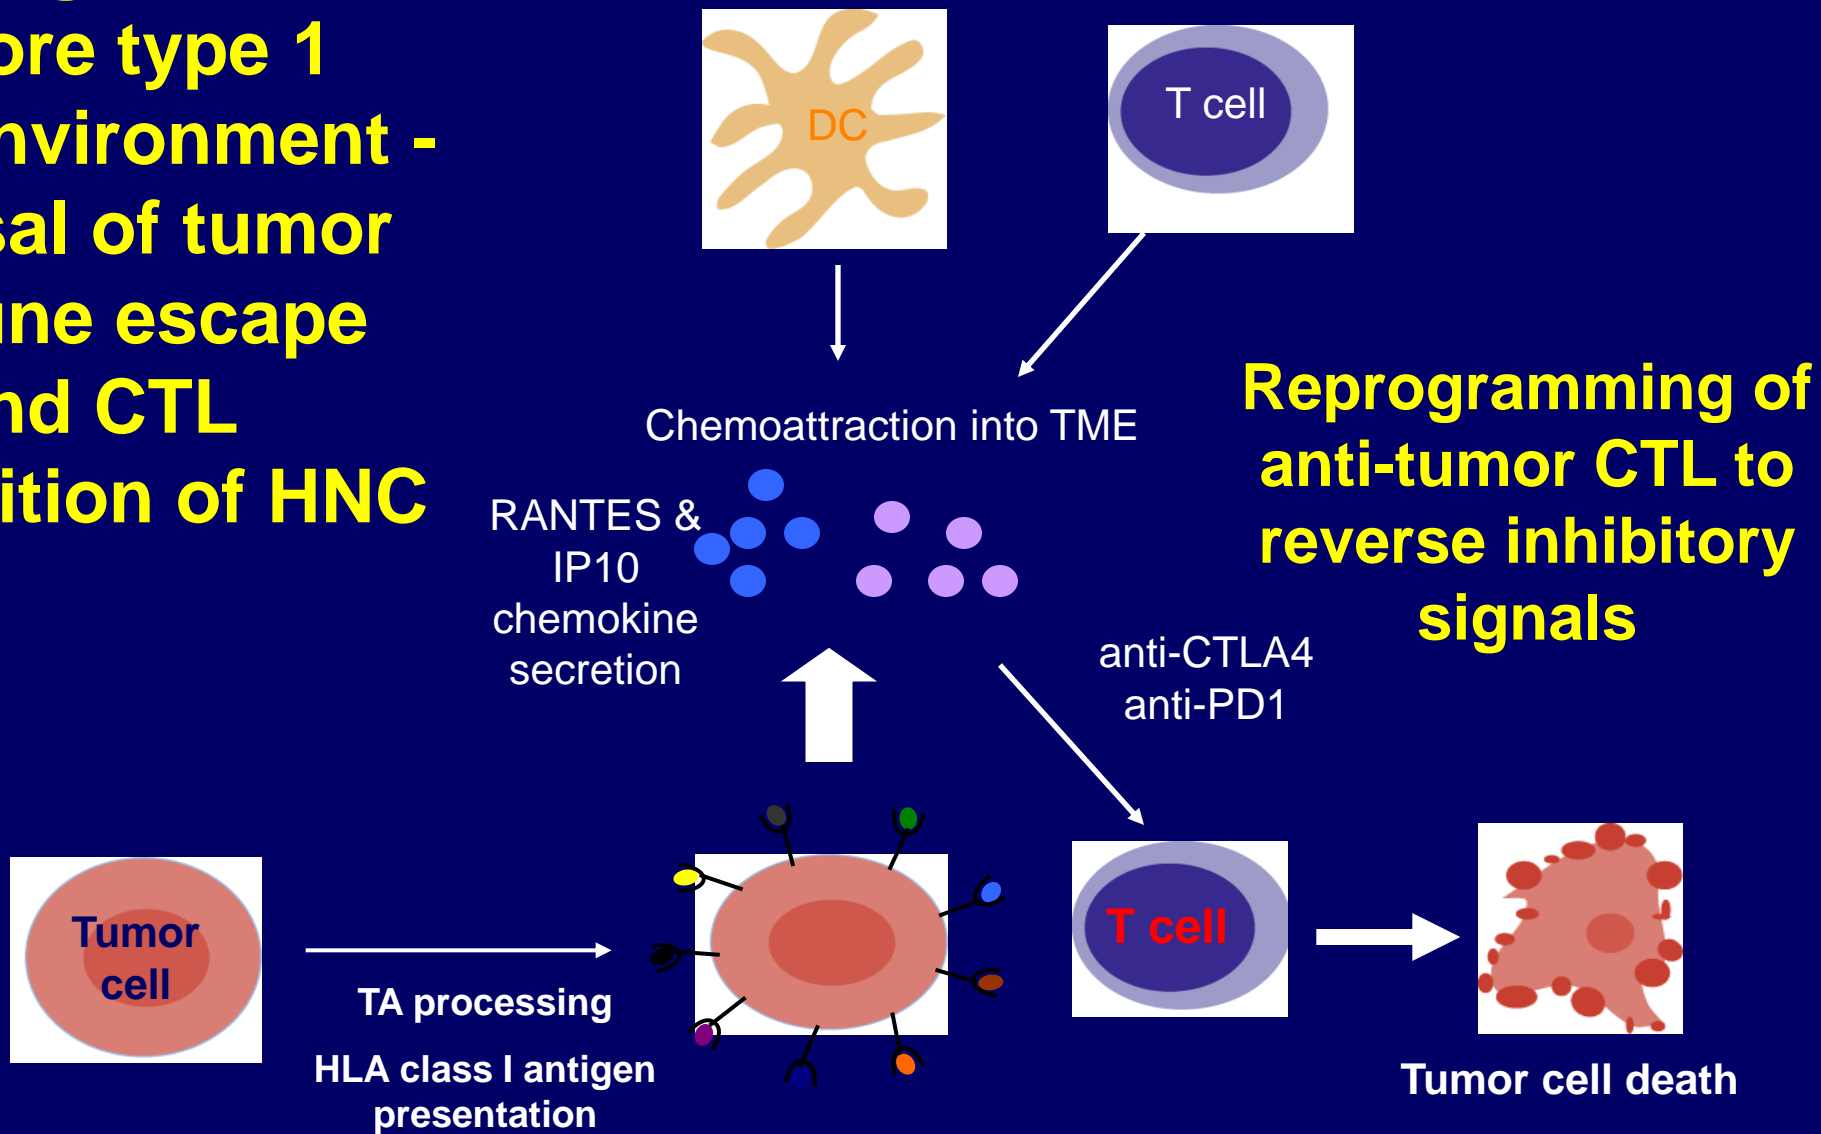

Active-8 trial: TLR8 adjuvant to enhance Cetuximab-based immunotherapy

Standard of care consists of platinum chemotherapy (cisplatin or carboplatin), 5-FU, and cetuximab

**Targeting model to
restore type 1
microenvironment -
reversal of tumor
immune escape
and CTL
recognition of HNC**
